

MD ADHESIVES[®]
FOR MEDICAL DEVICE ASSEMBLY

Only Dymax offers expert knowledge of light-cure technology, along with a full array of light-cure products. Dymax is committed to developing a true collaborative partnership — applying our extensive process knowledge to your specific application challenges.

We create custom solutions to ensure that chemistry and equipment work seamlessly together with maximum efficiency. Our application engineering team works side-by-side with our customers, providing assistance with formulation, testing, evaluation, and pre-production trials. We also offer an extensive inventory of curing equipment, manual and automated dispensing systems to help you achieve a more efficient, cost-effective manufacturing process.

About Our Products

Since pioneering light-cure technology over 40 years ago, Dymax has continued to develop innovative ways to optimize disposable medical device assembly. We understand the demands of the medical device market and are ready to assist you with every step of the product development process including adhesive selection, dispensing options, curing recommendations, bio-compatibility testing, component design, and process validation. We are continually developing new technologies to help you build safer, better quality products that increase your manufacturing efficiency, and deliver the best possible outcomes.

Our Commitment to Greener, Safer Manufacturing

Dymax is committed to green manufacturing that reduces environmental impact, conserves energy, and provides greater worker safety. Over the last 40 years, our light-curable materials and curing equipment have become the industry standard for fast, environmentally conscious assembly. Dymax products are readily replacing technologies that contain hazardous ingredients, produce waste, or require higher amounts of energy to process.

Eco-friendly, one-component materials

Materials without solvents and other materials of concern for improved worker and user safety

Fast curing products and equipment designed for less energy consumption

Dymax products conform to regulatory standards like RoHS and REACH

MD[®] Adhesives

Dymax MD[®] Adhesives are specially formulated for disposable medical device assembly and used in a variety of applications including catheter, syringe, anesthesia mask, reservoir, tube set, and medical electronics assembly.*

Our adhesives help optimize assembly speeds enabling faster processing, greater output, and in-line inspection of bond lines. Our adhesives are solvent-free and RoHS-compliant, and many meet USP Class VI and/or ISO 10993 bio-compatibility standards.

* MD[®] adhesives are intended for use in short-term (<29 days) or single-use disposable-device applications only. Dymax does not authorize their use in long-term implant applications. In all cases, it's the user's responsibility to determine and validate the suitability of these adhesives in the intended medical device.

Compatible sterilization methods include gamma irradiation and ethylene oxide. Sterilization by autoclaving may be limited to certain applications. It remains the user's obligation to ascertain the effect of sterilization on the cured adhesive.

Multipurpose Adhesives

Dymax 1000-series adhesives are solvent-free and cure within seconds upon exposure to UV and visible light, permitting bonding of UV-inhibited and tinted plastics. Many 1000-series adhesives are formulated with patented Dymax fluorescing technology, causing them to glow brightly when exposed to a low-intensity “black light”. This technology enhances the functionality of automated vision equipment for high-speed, high-volume production.

Adhesives for Catheter Assembly

These single-component adhesives provide excellent adhesion, a high degree of flexibility, and fast light cures for consistent, low stress catheter assembly. CTH products also provide excellent moisture and humidity resistance and are available with patented fluorescing technology, making in-line inspection easy.

Adhesives for Needle Assembly

Dymax MD® adhesives are ideal for automated high-speed needle assembly lines that incorporate immediate in-line testing and packaging. These single-component adhesives cure rapidly upon exposure to the proper combination of high-intensity visible and long wave UV light. The ability to cure with visible light allows for bonding of UV-blocking or heavily tinted plastics. Their fluorescing properties enhance the performance of automated sensing and vision systems, allow for easy detection of adhesive coverage and volume, and lead to higher production yields and improved quality assurance.

Adhesives for Respiratory Devices

Dymax MSK UV/Visible light-curable adhesives are formulated for bonding respiratory devices such as anesthesia masks, resuscitator bags, and breathing circuits. On-demand bonding at line speeds greater than 20 feet per minute (6.1 meters per minute) is possible, providing increased through-put without additional labor or line expansion. Some MSK adhesives are formulated to fluoresce blue or red upon exposure to low-intensity “black” light, making them ideally suited for in-line inspection. Dymax respiratory-device adhesives are easily dispensed by syringe, dipping well, screen print, or spray and are compatible with gamma, EtO, and E-Beam sterilization.

Maskants for Orthopaedics & Surgical Tools

SpeedMask® light-curable maskants provide superior surface protection of orthopaedic implants, surgical instruments, and medical devices during aggressive surface finishing processes. They cure in seconds upon exposure to UV/broad-spectrum light and replace traditional masking materials such as tapes, lacquers, waxes, boots, and caps. SpeedMask® maskants are easily applied by syringe or through dipping, spraying, or screen printing, and are available in peelable or burn-off grades that leave component surfaces residue free.

Adhesive Technologies

As an innovator in the adhesive and coating industries, Dymax strives to create new technologies that help manufacturers increase process efficiency, productivity, and throughput while decreasing costs and inventory. Through the years, our dedication to innovation has resulted in over 30 oligomer, adhesive, and equipment patents and numerous awards for our innovative technologies and service.

Our R&D experts are always striving to create new technologies that will help manufacturers improve their processes and minimize risk. Our current portfolio of technologies provide a variety of benefits including easier bond line inspection and cure confirmation for better quality control, faster cures for quicker processing, and curing in shadowed areas to eliminate concerns about uncured material.

Confirm Placement & Cure - Patented See-Cure Technology

Dymax adhesives formulated with See-Cure technology have built-in cure validation that makes it easy for operators or simple automated inspection equipment to confirm cure without investing in additional specialized equipment. These materials are bright blue in their uncured state, making them highly visible when dispensed onto substrates. Workers can easily confirm the adhesive placement and quantity with just their eyes.

After the adhesive is exposed to light, the color transitions from blue to colorless. This cure indicator ensures the adhesive is completely cured, providing a critical safety feature for manufacturing processes.

Speed up Production with Faster Cures - LED Light-Curing Technology

Dymax offers specially formulated LED light-curable adhesives that are optimized to work seamlessly with Dymax LED light-curing systems. The adhesives range from fast to ultra-fast cure speeds in order to accommodate specific assembly needs. LED-curing equipment is available in a number of different styles including spot lamps, flood lamps, and conveyors to accommodate various process requirements.

Enhance Bond-Line Inspection - Ultra-Red® Technology

Adhesives formulated with Ultra-Red remain colorless until exposed to low-intensity UV light (360-380 nm), at which point they fluoresce bright red. This is ideal when bonding plastics that naturally fluoresce blue. Ultra-Red fluorescence does not absorb the same wavelengths as those used to cure the adhesive, resulting in faster, deeper cures when compared to blue fluorescing products.

The Ultra-Red fluorescing compound is patented and exclusive to Dymax. When measured, this compound produces a unique energy peak that cannot be reproduced by other fluorescing compounds. This offers manufacturers the ability to assemble or mark their products so they can be positively identified.

Enhance Bond-Line Inspection - Blue Fluorescing Technology

In addition to Ultra-Red fluorescing adhesives, Dymax also manufactures products that fluoresce blue under low-intensity "black" light (365 nm). The fluorescing characteristic of these materials is ideal for in-line inspection, allowing bond lines to be inspected easily.

Enhance Bond-Line Inspection & Confirm Cure - Encompass® Technology

Dymax adhesives formulated with Encompass technology incorporate Dymax exclusive Ultra-Red fluorescing and See-Cure color-change technologies into one light-curable product. As a result, manufacturers gain efficiencies from rapid on-demand curing with easy cure confirmation and post-cure bond-line inspection.

Cure in Shadows - Multi-Cure® Light/Heat Cure Technology

Multi-Cure adhesives and coatings combine the high-speed cure of UV or UV/Visible light with secondary cure mechanisms that enhance polymerization. Secondary cure mechanisms, which include moisture, thermal, or activator cure, are useful when light can only reach a portion of the bond line, or when tacking a part prior to final cure to allow easier handling and transport during the manufacturing process.

Dispensing & Curing Equipment

Dymax dispensing and light-curing systems are perfectly matched to our adhesives' chemistry. Our field-proven dispense solutions are designed to fit many adhesive dispensing applications and include various automatic and manual dispense systems, spray valves, and related components for seamless integration into your assembly process.

We offer a complete line of conventional and LED light-curing equipment including spot, flood, and conveyor systems, as well as radiometers for measuring light intensity. Our equipment can be configured as stand-alone units or integrated into existing manufacturing assembly lines for fast processing.

BlueWave® MX-Series Systems

BlueWave MX-Series curing systems feature all the benefits of LED-curing technology in smaller, more versatile units. These systems are uniquely designed to offer higher, more consistent curing intensity than traditional spot or flood curing systems. They are comprised of a power supply, a controller with an easy-to-use control interface, and an emitter. Emitters are available in three models, the MX-150 (spot), MX-250 (flood), and MX-275 (line) as well as in three different curing wavelengths, 365, 385, and 405 nm.

BlueWave® 200

The BlueWave 200 spot-curing lamp delivers UV and visible energy (300-450 nm) for curing adhesives, coatings, and encapsulants. The lamp uses a patented intensity adjustment feature that allows users to deliver the optimized level of energy for their application requirements. The system contains an integral shutter which can be actuated by a foot pedal or PLC making it ideal for both manual and automated processes.

BlueWave® AX-550

The BlueWave AX-550 combines a controller, emitter, and power supply into a compact, all-in-one LED flood-curing system. Eliminating the need for a large, traditional-style controller and bulky cables, this unit has a greatly reduced footprint and is easily integrated into automated processes.

The system features a large 5" x 5" (12.5 x 12.5 cm) curing area, which is controlled by a user interface with push-button controls or through a PLC interface. Dymax offers the system with three different wavelength emitters (365, 385, and 405 nm), which are field-upgradeable by customers so they can switch to another wavelength easily if needed.

BlueWave® QX4

The BlueWave QX4 spot-cure system consists of a controller and up to four LED heads. LED heads are available in 365, 385, and 405 nm and can be outfitted with 3-, 5-, or 8-mm diameter focusing lenses. The system offers maximum curing flexibility to users. Each head can be individually programmed for intensity and cycle times. Individual exposure times and intensity settings can be set in 1% increments for each LED head allowing for a completely customized spot-cure process.

UVCS Conveyor Systems

Dymax conveyor systems use high-intensity light sources for fast curing of adhesives, coatings, inks, and encapsulants. UVCS bench-top conveyors can be outfitted with up to four UV or LED flood lamps, or for higher energy requirements, can be configured with microwave-driven light sources. All configurations have adjustable belt speeds of 1 to 32 feet per minute, and adjustable lamp-to-belt distance to address a variety of application requirements. When combined, the UVCS conveyors' consistent intensity, fast curing, and adjustable line speeds create an optimized UV-curing process that enables high throughput.

ACCU-CAL™ Radiometers

ACCU-CAL radiometers allow operators to monitor, document, and maintain a reliable light-curing process, while ensuring the system is providing the intensity and dosage levels required for successful curing. A radiometer can signal an operator to replace a curing system's degrading bulb, reflector, or lightguide to help prevent incomplete cures from happening. ACCU-CAL radiometers can also measure the intensity of stray or reflected energy and confirm that operators are properly shielded from light exposure.

SD-200 Digital Syringe Dispenser

The SD-200 digital syringe dispenser accurately dispenses low-to-high viscosity materials from a syringe. Operators are able to quickly and easily set up the system for the deposit size needed by utilizing the digital timer control and adjustable pressure gauge. The digital timer has a range of 0.01 to 9999 seconds giving the operator precise control over fluid dispense, and the adjustable vacuum suck-back results in clean, drip-free shut-off of materials. This dispensing system replaces manual syringe dispensers and squeeze bottles, reducing operator fatigue. It's ideal for use as an operator work station and can also be integrated into an automated process. The SD-200, a portable light-weight unit with a space-saving footprint, is compatible with a variety of syringe sizes from 3 to 55 cc.

Reference Tables

Joint Design

An adhesive should be chosen according to the needs of the application and joint design.

Well Configuration

A hub that is flared at the distal end is described as a “well” configuration. Filling the well with adhesive secures the needle in place. In many cases the hubs are opaque but can be cured from above so UV light is not required to pass through the plastic. In the “well” design, adhesion to both the hub substrate and cannula are of critical importance. The well in this configuration is usually large enough to permit using mid-range viscosities.

Mechanical Lock

A hub can be molded with annular grooves in its inside diameter. The annular rings are typically 0.005” to 0.008” (0.127-0.2 mm) deep per side subject to molding limitations. This allows the cured adhesive to form a mechanical lock, substantially increasing pullout strength. Adhesives will form a structural bond with the stainless steel cannula and lock in place with the added groove feature. With this design, a low- to medium-viscosity adhesive is used to wick between the stainless steel cannula and hub forming a mechanical lock.

Cylindrical Hub

The close-fitting cannula-to-hub design is commonly encountered in medical disposable syringes. A cylindrical hub that is closely fit to the cannula requires a low-wicking-grade-viscosity adhesive. It is also critical to choose an adhesive that has superior bond strength to both substrates. Recommended gap: 0.002”-0.004” (0.05-0.1 mm) per side.

Bridge Bonding

The cannula can be attached to the mating part by bridge bonding, which entails placing an adhesive bead over the top of the cannula. This design overcomes the problem of getting light into a shadowed area for the purpose of curing the adhesive.

Viscosity

When choosing a viscosity, consideration should be given to how the adhesive must flow (or not flow) on the part after the adhesive is applied. Part geometry, process design, and assembly speed and method should all be considered when selecting viscosity.

Viscosity is a material's resistance to flow. Low-viscosity adhesives flow more readily than high- viscosity adhesives. Thixotropic gels flow very slowly and are recommended when adhesive flow on a part after dispensing must be minimal.

Dymax adhesives are available in a variety of viscosities. The identifiers appear as suffixes on product names as follows:

VLV = Very Low Viscosity VT = Very Thick

LV = Low Viscosity GEL = Gel

T = Thick

Standard viscosity products do not have a suffix.

Typical Centipoise (cP/MPas)	Typical Reference Liquids at 20°C
1	Water
10	Kerosene
110	SAE 10 Oil
200	Maple Syrup
440	SAE 30 Oil
1,100	Castor Oil
